

## Implementing a redirect.

For a variety of reasons you might wish to redirect pages to another location:

Examples of this are

1. You've moved the page
2. You've transitioned from an AIRS site to WOW

### **FIRST BACK UP ANY PAGE YOU PLAN TO CHANGE.**

Then

To redirect simply replace the contents of the page with the following code

```
<HTML><HEAD><META HTTP-EQUIV="Refresh" CONTENT="0;
URL=http://www.DOMAINNAME.com"></HEAD><BODY>Now you will be automatically redirected to
the required website. If your browser does not support redirection, please click <a href="
http://www.DOMAINNAME.com"> here </a></BODY></HTML>
```

You'll need to replace the yellow highlighted portions with the actual target URL

If redirecting your whole site you need to do this for your home page at a minimum.

If you have other pages that you believe visitors might be directly accessing you should do so for those pages as well.
